General + Underclassmen tracks

The Problem

With the emergence of AI, we, as users and consumers of the product, have become reliant on the answers provided as long as the presented information is considered believable and convincing. However, we lack the cited sources where this information is being read from. Unlike a browser search, where we can form our own informed judgments about the reliability of the results, AI lacks that credibility, making it difficult to trust responses created from unknown sources.

How we are addressing it

Liquid is designed to address the growing tendency for users to accept AI-generated information without understanding its origin or limitations. Instead of treating AI responses as standalone answers, Liquid intentionally pairs research-based outputs with accessible source links, encouraging users to engage more critically with the information presented.

By integrating transparency directly into the conversational interface, Liquid lowers the barrier to verification and exploration. Users can choose when and how deeply to investigate supporting sources, allowing them to contextualize responses rather than passively consume them. This design approach shifts the role of AI from an authority figure to a starting point for inquiry, helping users develop more informed and reflective interactions with AI systems.
